

CRM VO

Project overview

A Vehicle/Automotive CRM (Customer Relationship Management) system for managing vehicle sales, inventory, offers, and customer relations.

Technologies used

Backend framework

- CodeIgniter 3.x (PHP MVC framework)
- PHP
- MySQL/MariaDB (database `crm_mo_bd`)
- Additional database connection: `apiScraping_db` (for scraping data)

Frontend

- JavaScript (jQuery)
- CSS (custom stylesheets)
- HTML/PHP views (CodeIgniter views)
- Bootstrap (likely, based on structure)
- DataTables (for data grids)

Libraries and dependencies

- mPDF (v8.2) — PDF generation
- TCPDF — PDF generation
- DomPDF — PDF generation
- PHPExcel/PhpSpreadsheet — Excel handling
- SendinBlue — Email service
- Custom libraries: FTP client, SFTP client, Image manipulation, CURL

Other

- Composer (dependency management)
- Apache/Nginx (web server)
- File upload handling
- CORS support (via hooks)

Project functionality

Core modules

1. CRM module (`app/modules/crm/`) — vehicle lifecycle:
 - Vehicles management (status tracking, catalogs)
 - Stock management

- Reprises (trade-ins)
 - Offers (sales offers, BDC management)
 - Expertise (manual & DEKRA)
 - Livraisons (deliveries)
 - Documents (contracts, invoices, certificates)
 - Vendus (sold vehicles)
2. Clients `app/modules/clients/` — customer management
 3. Leads `app/modules/leads/` — lead management
 4. Planning `app/modules/planning/` — scheduling
 5. SAV (Service After Sale) `app/modules/sav/` — after-sales service
 6. Dashboard `app/modules/dashboard/` — analytics and reports
 7. Settings `app/modules/settings/` — system configuration

Vehicle status workflow

- En cours de création
- Estimation de reprise/d'entrée
- Stock
- Immobilisé
- En cours de livraison
- Livré
- Réservé
- Disponible à la vente
- Vendu
- Offre vente en cours
- Archivé

Features

- Vehicle catalog management
- Price quoting (cotation) system
- DEKRA integration (vehicle inspection)
- Document generation (contracts, invoices, certificates, labels)
- File management (FTP/SFTP)
- Email notifications (SendinBlue)
- Multi-language support (French, English)
- Authentication & authorization
- Stock migration tools
- Excel import/export

The application is configured for the Casablanca timezone (`Africa/Casablanca`), suggesting it's used in Morocco.

GUID INSTALLTION CODEIGNITER3.1.13

- xamp
- php
- enable some extension in php.ini

- in system/core/controller and other files before declare any class you should to set this `#[\AllowDynamicProperties]` to allow create dynamicly property exemple if you class car () with this properti name and imm and after while you need to add new property ,so that why you should to do that

HMVC:

If you **do not have the folder application/third_party containing MX files**, then **HMVC is NOT installed**, so your modules will NEVER work.

✅ **CodeIgniter 3 does NOT support HMVC by default.**

✅ You MUST install **Wiredesignz HMVC extension**.

Without it, this URL:

/auth

will ALWAYS give 404 — because CI3 cannot load modules without HMVC support.

✅✅ 1. What is third_party?

It's a folder inside application/ where CodeIgniter loads external packages such as HMVC.

Path:

application/

third_party/

MX/

Modules.php

MX_Controller.php

MX_Loader.php

MX_Router.php

✅ These files allow CodeIgniter to recognize:

- /app/modules/...
- module controllers
- module models
- module views

Without them → NO HMVC.

✓✓ 2. Install HMVC (Wiredesignz MX Extensions)

Here are the EXACT steps to fix your project.

✓ Step 1: Create folder

Go to:

`application/third_party/`

If `third_party` does NOT exist → create it manually.

✓ Step 2: Download HMVC package

Download from official mirror:

✓ <https://bitbucket.org/wiredesignz/codeigniter-modular-extensions-hmvc/downloads/>

You need this version:

`codeigniter-modular-extensions-hmvc-5.5`

After extracting, copy this folder:

`MX/`

into:

`application/third_party/MX/`

Inside MX folder you must have:

`Modules.php`

`MX_Controller.php`

`MX_Loader.php`

`MX_Router.php`

✓✓ 3. Add core extensions

Create this file:

`application/core/MY_Controller.php`

Add this:

```
<?php
```

```
require APPPATH . 'third_party/MX/Controller.php';
```

```
class MY_Controller extends MX_Controller {}
```

Same for Loader:

```
application/core/MY_Loader.php
```

```
<?php
```

```
require APPPATH . 'third_party/MX/Loader.php';
```

```
class MY_Loader extends MX_Loader {}
```

Same for Router (only if needed):

```
application/core/MY_Router.php
```

4. In your custom base controller

Your STA_Controller should extend MY_Controller :

```
class STA_Controller extends MY_Controller
```

```
{
```

```
    public function __construct()
```

```
    {
```

```
        parent::__construct();
```

```
    }
```

```
}
```

Now HMVC is fully functional.

5. Folder structure after fixing

application/

core/

MY_Controller.php

MY_Loader.php

third_party/

MX/

Modules.php

MX_Controller.php

MX_Loader.php

MX_Router.php

app/

modules/

auth/

controllers/

Auth.php

models/

AuthModel.php

views/

index.php

- ✓ Now /auth will work
- ✓ All modules will load correctly
- ✓ HMVC is activated

✓ ✓ 6. Test

Create a quick test method in Auth:

```
public function test() {  
  
    echo "HMVC works!";  
}
```

```
}
```

Then open:

<http://localhost/crm-vo/auth/test>

If you see **HMVC works!**, your system is fixed.

✓ Want me to generate the correct HMVC structure (files + code) for your CRM?

I can prepare:

- ✓ Correct MY_Controller.php
- ✓ Correct MY_Loader.php
- ✓ Correct STA_Controller.php
- ✓ Correct .htaccess
- ✓ Correct module structure

summary: go to core and make it like that

The screenshot shows a code editor with a file explorer on the left and a code editor on the right. The file explorer shows the following structure:

- app
 - cache
 - config
 - controllers
 - core
 - index.html
 - MY_Loader.php
 - MY_Model.php
 - MY_Router.php
 - STA_Controller.php
 - helpers
 - hooks
 - language
 - libraries
 - logs
 - models
 - modules
 - third_party
 - views
 - .htaccess
 - index.html
 - public
 - system
- OUTLINE
- TIMELINE

The code editor shows the content of MY_Model.php:

```
1 <?php
2 defined('BASEPATH') OR exit('No direct script access allowed');
3
4 class MY_Model extends CI_Model {
5
6     protected $table;
7
8     public function __construct() {
9         parent::__construct();
10    }
11
12    public function insert($data) {
13        $this->db->insert($this->table, $data);
14        return $this->db->insert_id();
15    }
16
17    public function update($data, $where) {
18        $this->db->where($where);
19        return $this->db->update($this->table, $data);
20    }
21
22    public function delete($where) {
23        $this->db->where($where);
24        return $this->db->delete($this->table);
25    }
26
27    public function get_all() {
28        return $this->db->get($this->table)->result();
29    }
30 }
```

E-COM...

app > third_party > MX > Router.php

app > third_party > MX > Router.php

app > third_party > MX > Router.php

1 <?php (defined('BASEPATH')) OR exit('No direct script access allowed');

2

3 /* Load the MX core module class */

4 require dirname(__FILE__).'/Modules.php';

5

6 /**

7 * Modular Extensions - HMVC
